Diffuse White

Diffuse White

- Reeves White does a great job at keeping light transmission high vs other white colorants, while creating a nice white appearance when the light is on and off
- Certain profile designs, however, will create shadows or dark areas:
 - Corners in thick profiles, like square tubes
 - Profiles where the lens expands past the legs
 - Profiles where light does not have a direct path to the lens
- We created Diffuse White to help improve lens performance in these situations

Diffuse White (Cont'd)

- Diffuse White helps illuminate corners, especially with thick lenses
- Pictured below is a 2.00" OD square tube with 0.250" wall

Light Off

Light On

Reeves White

Diffuse White

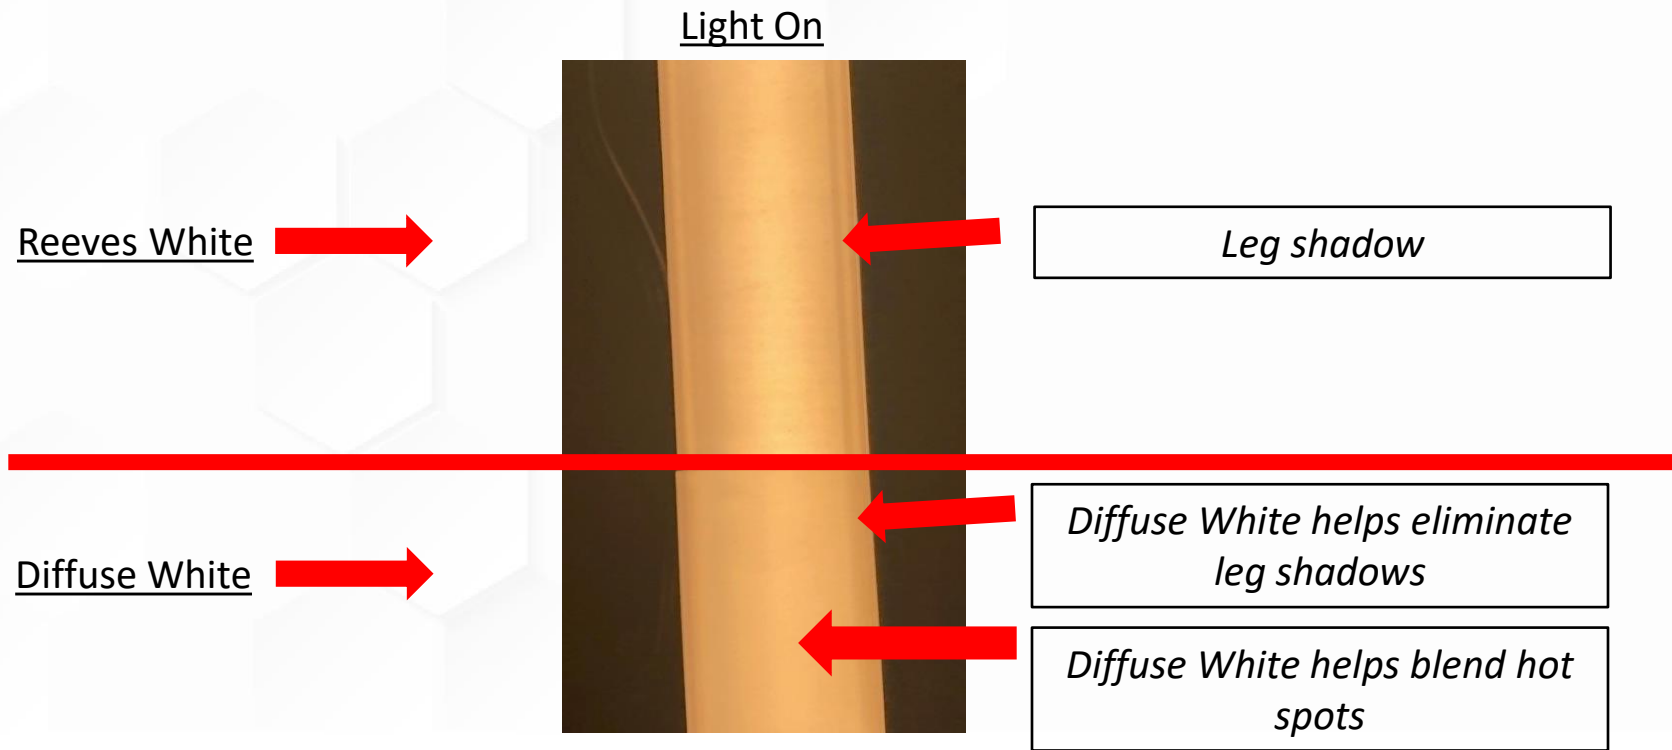

Diffuse White is less white in appearance when light is off

Diffuse White still glows white, but with less shadowing in corners

Diffuse White (Cont'd)

- Diffuse White helps hide leg shadows and can improve light diffusion without sacrificing light transmission
- Pictured below is a 0.060" wall where the lens is wider than the legs
